

Bottom Port PDM Low-Power Multi-Mode Microphone With High AOP Mode

GENERAL DESCRIPTION

The T3902 is a low-power, low-noise digital MEMS microphone in a small package. The T3902 consists of a MEMS microphone element and an impedance converter amplifier followed by a fourth-order Σ - Δ modulator. The pulse density modulated (PDM) interface allows two microphones to be time multiplexed on a data line using a single clock.

The T3902 has multiple modes of operation: High Performance, Low Power (AlwaysOn), Standard and Sleep. The T3902 has low power and high SNR in all operational modes. It has 126 dB SPL AOP in High Performance mode, and 120 dB SPL AOP in Standard and Low-Power modes.

The T3902 supports ultrasound applications in High Performance Mode. It has an extended ultrasonic response up to 40 kHz with high SNR.

The T3902 is available in a small $3.5 \times 2.65 \times 0.98$ mm surface-mount package. It is reflow solder compatible with no sensitivity degradation.

APPLICATIONS

- Smartphones
- Microphone Arrays
- Tablets
- Cameras
- Bluetooth Headsets
- Notebook PCs
- Security and Surveillance

FEATURES

SPEC	LOW-POWER MODE	STANDARD MODE	HIGH PERFORMANCE MODE
Sensitivity	-26 dB FS ± 1 dB	-26 dB FS ± 1 dB	-32 dB FS ± 1 dB
SNR	63 dBA	64 dBA	64 dBA
Current	185 μ A	430 μ A	650 μ A
AOP	120 dB SPL	120 dB SPL	126 dB SPL
Clock	400 – 800 kHz	1.0 – 3.3 MHz	4.1 – 4.8 MHz

- $3.5 \times 2.65 \times 0.98$ mm surface-mount package
- Low power: 185 μ A in Low-Power Mode
- Extended frequency response from 50 Hz to >20 kHz
- Ultrasound support up to 40 kHz
- Sleep Mode: 12 μ A
- High power supply rejection (PSR): -97 dB FS
- Fourth-order Σ - Δ modulator
- Digital pulse density modulation (PDM) output
- Compatible with Sn/Pb and Pb-free solder processes
- RoHS/WEEE compliant

ABSOLUTE MAXIMUM RATINGS

Stress above those listed as Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to the absolute maximum ratings conditions for extended periods may affect device reliability.

TABLE 7. ABSOLUTE MAXIMUM RATINGS

PARAMETER	RATING
Supply Voltage (V_{DD})	-0.3 V to +3.63 V
Digital Pin Input Voltage	-0.3 V to $V_{DD} + 0.3$ V or 3.63 V, whichever is less
Sound Pressure Level	160 dB
Mechanical Shock	10,000 g
Vibration	Per MIL-STD-883 Method 2007, Test Condition B
Temperature Range	
Biased	-40°C to +85°C
Storage	-55°C to +150°C

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

SOLDERING PROFILE

*The reflow profile in Table 8 is recommended for board manufacturing with InvenSense MEMS microphones. All microphones are also compatible with the J-STD-020 profile

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

Figure 3. Pin Configuration (Top View, Terminal Side Down)

TABLE 9. PIN FUNCTION DESCRIPTIONS

PIN	NAME	FUNCTION
1	DATA	Digital Output Signal (DATA1 or DATA2)
2	SELECT	Left Channel or Right Channel Select: DATA 1 (right): SELECT tied to GND DATA 2 (left): SELECT tied to VDD. In this setting, SELECT should be tied to the same voltage source as the VDD pin.
3	GND	Ground
4	CLK	Clock Input to Microphone
5	VDD	Power Supply. For best performance and to avoid potential parasitic artifacts, place a 0.1 μ F (100 nF) ceramic type X7R capacitor between Pin 5 (VDD) and ground. Place the capacitor as close to Pin 5 as possible.

THEORY OF OPERATION

PDM DATA FORMAT

The output from the DATA pin of the T3902 is in pulse density modulated (PDM) format. This data is the 1-bit output of a fourth-order Σ - Δ modulator. The data is encoded so that the left channel is clocked on the falling edge of CLK, and the right channel is clocked on the rising edge of CLK. After driving the DATA signal high or low in the appropriate half frame of the CLK signal, the DATA driver of the microphone tristates. In this way, two microphones, one set to the left channel and the other to the right, can drive a single DATA line. See Figure 1 for a timing diagram of the PDM data format; the DATA1 and DATA2 lines shown in this figure are two halves of the single physical DATA signal. Figure 8 shows a diagram of the two stereo channels sharing a common DATA line.

Figure 8. Stereo PDM Format

If only one microphone is connected to the DATA signal, the output is only clocked on a single edge (Figure 9). For example, a left channel microphone is never clocked on the rising edge of CLK. In a single microphone application, each bit of the DATA signal is typically held for the full CLK period until the next transition because the leakage of the DATA line is not enough to discharge the line while the driver is tristated.

Figure 9. Mono PDM Format

See Table 10 for the channel assignments according to the logic level on the SELECT pin.

TABLE 10. T3902 CHANNEL SETTING

SELECT Pin Setting	Channel
Low (tie to GND)	Right (DATA1)
High (tie to VDD)	Left (DATA2)

For PDM data, the density of the pulses indicates the signal amplitude. A high density of high pulses indicates a signal near positive full scale, and a high density of low pulses indicates a signal near negative full scale. A perfect zero (dc) audio signal shows an alternating pattern of high and low pulses.

The output PDM data signal has a dc offset of about 3% of full scale. A high-pass filter in the codec that is connected to the digital microphone and does not affect the performance of the microphone typically removes this dc signal.

PDM MICROPHONE SENSITIVITY

The sensitivity of a PDM output microphone is specified with the unit dB FS (decibels relative to digital full scale). A 0 dB FS sine wave is defined as a signal whose peak just touches the full-scale code of the digital word (see Figure 10). This measurement convention also means that signals with a different crest factor may have an RMS level higher than 0 dB FS. For example, a full-scale square wave has an RMS level of 3 dB FS.

This definition of a 0 dB FS signal must be understood when measuring the sensitivity of the T3902. A 1 kHz sine wave at a 94 dB SPL acoustic input to the T3902 results in an output signal with a -26 dB FS level in Standard Mode and -32 dB FS in High Performance

Mode. In the Standard Mode example, the output digital word peaks at -26 dB below the digital full-scale level. A common misunderstanding is that the output has an RMS level of -29 dB FS; however, this is not true because of the definition of the 0 dB FS sine wave.

Figure 10. 1 kHz, 0 dB FS Sine Wave

There is not a commonly accepted unit of measurement to express the instantaneous level, as opposed to the RMS level of the signal, of a digital signal output from the microphone. Some measurement systems express the instantaneous level of an individual sample in units of D, where 1.0 D is digital full scale. In this case, a -26 dB FS sine wave has peaks at 0.05 D.

APPLICATIONS INFORMATION

LOW POWER MODE

Low Power Mode (LPM) enables the T3902 to be used in an AlwaysOn listening mode for keyword spotting and ambient sound analysis. The T3902 will enter LPM when the frequency of SCK is between 400 and 800 kHz. In this mode, the microphone consumes only 185 μ A while retaining high electro-acoustic performance.

When one microphone is in LPM for AlwaysOn listening, a second microphone sharing the same data line may be powered down. In this case, where one microphone is powered up and another is powered down by disabling the VDD supply or in sleep mode by reducing the frequency of a separate clock source, the disabled microphone does not present a load to the signal on the LPM microphone's DATA pin.

DYNAMIC RANGE CONSIDERATIONS

The full-scale digital output (0 dB FS) of the T3902 is mapped to an acoustic input of 126 dB SPL in high-performance mode. The microphone clips (THD = 10%) at 126 dB SPL (see Figure 5); however, it continues to output an increasingly distorted signal above that point. The peak output level, which is controlled by the modulator, limits at 0 dB FS (see Figure 7).

To fully use the 96 dB dynamic range of the output data of the T3902 in a design, the digital signal processor (DSP), analog-to-digital converter (ADC), or codec circuit following it must be chosen carefully. The decimation filter that inputs the PDM signal from the T3902 must have a dynamic range sufficiently better than the dynamic range of the microphone so that the overall noise performance of the system is not degraded. If the decimation filter has a dynamic range of 10 dB better than the microphone, the overall system noise only degrades by 0.4 dB. This 106 dB filter dynamic range requires the filter to have at least 18 bit resolution.

CONNECTING PDM MICROPHONES

A PDM output microphone is typically connected to a codec with a dedicated PDM input. This codec separately decodes the left and right channels and filters the high sample rate modulated data back to the audio frequency band. This codec also generates the clock for the PDM microphones or is synchronous with the source that is generating the clock. Figure 11 and Figure 12 show mono and stereo connections of the T3902 to a codec. The mono connection shows an T3902 set to output data on the right channel. To output on the left channel, tie the SELECT pin to VDD instead of tying it to GND.

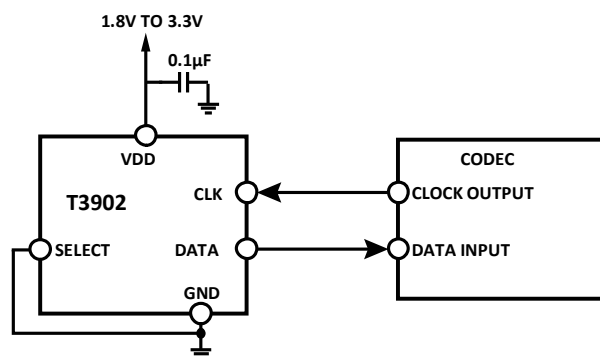

Figure 11. Mono PDM Microphone (Right Channel) Connection to Codec

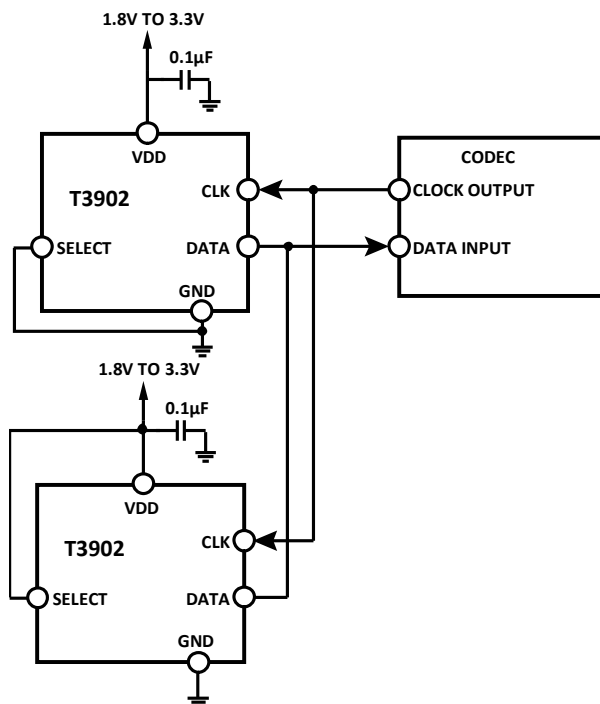

Figure 12. Stereo PDM Microphone Connection to Codec

Decouple the VDD pin of the T3902 to GND with a 0.1 µF capacitor. Place this capacitor as close to VDD as the printed circuit board (PCB) layout allows.

Do not use a pull-up or pull-down resistor on the PDM data signal line because it can pull the signal to an incorrect state during the period that the signal line is tristated.

The DATA signal does not need to be buffered in normal use when the T3902 microphone(s) is placed close to the codec on the PCB. If the DATA signal must be driven over a long cable (>15 cm) or other large capacitive load, a digital buffer may be required. Only use a signal buffer on the DATA line when one microphone is in use or after the point where two microphones are connected (see Figure 13). The DATA output of each microphone in a stereo configuration cannot be individually buffered because the two buffer outputs cannot drive a single signal line. If a buffer is used, take care to select one with low propagation delay so that the timing of the data connected to the codec is not corrupted.

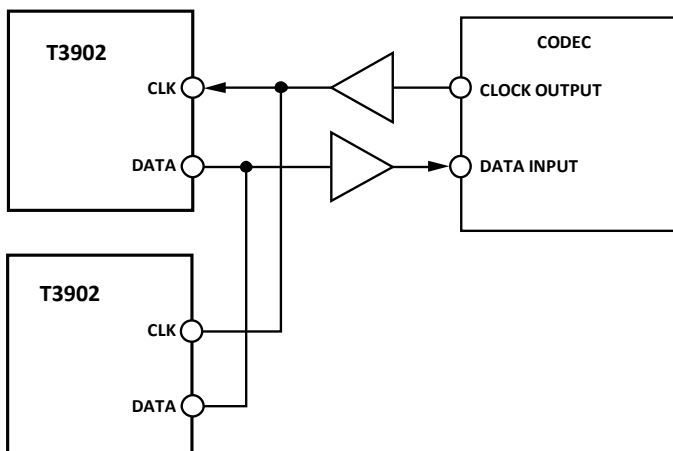

Figure 13. Buffered Connections Between Stereo T3902s and a Codec

When long wires are used to connect the codec to the T3902, a source termination resistor can be used on the clock output of the codec instead of a buffer to minimize signal overshoot or ringing. Match the value of this resistor to the characteristic impedance of the CLK trace on the PCB. Depending on the drive capability of the codec clock output, a buffer may still be needed, as shown in Figure 13.

ULTRASOUND APPLICATIONS

In its High Performance Mode, the T3902 functions as an ultrasonic sensor, as well as an audio band sensor. This microphone's ultrasonic performance will depend on the clock frequency, the low pass decimation filter, the strength of the ultrasonic signal being sensed, and the design of the acoustic port that is coupled to the microphone. The acoustic port design is especially important at higher frequencies, because the size of the port itself is on the order of $\frac{1}{4}$ the wavelength of sound and the acoustic mass loading will be significant. These will both contribute to the port having a considerable effect on the acoustic system's response.

SLEEP MODE

The microphone enters sleep mode when the clock frequency falls below 200 kHz. In this mode, the microphone data output is in a high impedance state. The current consumption in sleep mode is less than 20 μ A.

The T3902 enters sleep mode within 1 ms of the clock frequency falling below 200 kHz. The microphone wakes up from sleep mode and begins to output data within 20 ms of when the clock becomes active.

In sleep mode:

If the SELECT signal is logic high, the DATA pin will be pulled low to GND.

If the SELECT signal is logic low, the DATA pin will be high impedance (floating).

CLK	SELECT	DATA
<200kHz or float	VDD	GND
<200kHz or float	GND	HiZ

START-UP TIME

The start-up time of the T3902 is less than 20 ms. The PDM data from the microphone is valid to be used as soon as the data is being output.

PCB DESIGN AND LAND PATTERN LAYOUT

The recommended PCB land pattern for the T3902 is a 1:1 ratio of the solder pads on the microphone package, as shown in Figure 14. Avoid applying solder paste to the sound hole in the PCB. A suggested solder paste stencil pattern layout is shown in Figure 15.

The response of the T3902 is not affected by the PCB hole size as long as the hole is not smaller than the sound port of the microphone (0.375 mm in diameter). A 0.5 mm to 1 mm diameter for the hole is recommended. Take care to align the hole in the microphone package with the hole in the PCB. The exact degree of the alignment does not affect the microphone performance as long as the holes are not partially or completely blocked.

Figure 14. Recommended PCB Land Pattern Layout

Figure 15. Suggested Solder Paste Stencil Pattern Layout

PCB MATERIAL AND THICKNESS

The performance of the T3902 is not affected by PCB thickness. The T3902 can be mounted on either a rigid or flexible PCB. A flexible PCB with the microphone can be attached directly to the device housing with an adhesive layer. This mounting method offers a reliable seal around the sound port while providing the shortest acoustic path for good sound quality.

HANDLING INSTRUCTIONS

PICK AND PLACE EQUIPMENT

The MEMS microphone can be handled using standard pick-and-place and chip shooting equipment. Take care to avoid damage to the MEMS microphone structure as follows:

- Use a standard pickup tool to handle the microphone. Because the microphone hole is on the bottom of the package, the pickup tool can make contact with any part of the lid surface.
- Do not pick up the microphone with a vacuum tool that makes contact with the bottom side of the microphone. Do not pull air out of or blow air into the microphone port.
- Do not use excessive force to place the microphone on the PCB.

REFLOW SOLDER

For best results, the soldering profile must be in accordance with the recommendations of the manufacturer of the solder paste used to attach the MEMS microphone to the PCB. It is recommended that the solder reflow profile not exceed the limit conditions specified in Figure 2 and Table 8.

BOARD WASH

When washing the PCB, ensure that water does not make contact with the microphone port. Do not use blow-off procedures or ultrasonic cleaning.

However, no responsibility is assumed by InvenSense for its use, or for any infringements of patents or other rights of third parties that may result from its use. Specifications are subject to change without notice. InvenSense reserves the right to make changes to this product, including its circuits and software, in order to improve its design and/or performance, without prior notice. InvenSense makes no warranties, neither expressed nor implied, regarding the information and specifications contained in this document. InvenSense assumes no responsibility for any claims or damages arising from information contained in this document, or from the use of products and services detailed therein. This includes, but is not limited to, claims or damages based on the infringement of patents, copyrights, mask work and/or other intellectual property rights.

Certain intellectual property owned by InvenSense and described in this document is patent protected. No license is granted by implication or otherwise under any patent or patent rights of InvenSense. This publication supersedes and replaces all information previously supplied. Trademarks that are registered trademarks are the property of their respective companies. InvenSense sensors should not be used or sold in the development, storage, production or utilization of any conventional or mass-destructive weapons or for any other weapons or life threatening applications, as well as in any other life critical applications such as medical equipment, transportation, aerospace and nuclear instruments, undersea equipment, power plant equipment, disaster prevention and crime prevention equipment.
